

Please insert the following Abstract as a separate page after the claims.

ABSTRACT OF THE DISCLOSURE

An anti-theft device consists of a case comprising two large faces and four sides. One of the large faces forms an opening for the insertion of an article having dimensions that are essentially equal to those of the case. The opening face comprises a rim. The invention is characterized in that it comprises: a trigger member which can occupy a locked position and which can move in translation in the axis of the plane of the opening face which trigger member comprises at least one rim which co-operates with the above-mentioned rim in order to prevent the article from being extracted from the case and a locking pull tab which can move along an axis that is transverse to the movement of the trigger member and which can lock the trigger member in the locked position thereof.
